

EMS-Initiated Suboxone

EMS-initiated Suboxone is a new protocol spreading nationwide to combat overdose deaths and offer patients more advanced care following an overdose

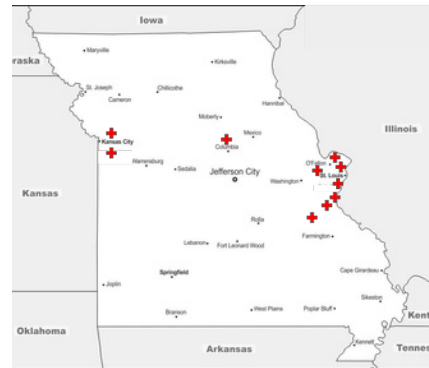

Patients who meet the protocol criteria will receive an initial dose of 16 mg of Suboxone, with the possibility of an additional 8 mg after reevaluation if needed.

Participating department's Medical Directors have approved this protocol for ALS staff, who have been trained in administration of medication and SUD/OD

EMS will collaborate with Engaging Patients in Care Coordinators (EPICC) to ensure that patients receive resources and follow-up care, including additional medication, after the call.

Participating Districts
